

Octal and hexadecimal (continued)

For "hex" numbers, we need 16 different numerals (but only have 10!)

d_j :	<u>0-9</u> , <u>A-F</u>	<u>Hex</u>	<u>Decimal</u>
	first 10 use letters	A	10
		B	11
		C	12
		D	13
		E	14
		F	15

Example : Find decimal equivalent of $3A9.C_{16}$

$$\begin{aligned} D &= 3 \times 16^2 + 10 \times 16^1 + 9 \times 16^0 + 12 \times 16^{-1} \\ &= 937.75_{10} \end{aligned}$$

Binary, octal, hex are all closely related. Octal and hex are groups of bits

- octal: 3-bit groupings
- hex: 4-bit groupings

Example: Express 11010_2 in octal and hex

pad to make 3-bit group \rightarrow $011010.$ always start here \rightarrow

$\underbrace{011}_3 \underbrace{010}_2$ $= 32_8$

pad \rightarrow $00011010.$

$\underbrace{000}_1 \underbrace{11010}_{A_{16} (10_{10})}$ $= 1A_{16}$

Example: Decimal to hexadecimal conversion. Convert 487_{10} to hex and octal.

$$\begin{array}{lll} 487 \div 16 = 30, & 7 \text{ remainder} & d_0 = 7 \\ 30 \div 16 = 1, & 14 \text{ remainder} & d_1 = 14_{10} = E_{16} \\ 1 \div 16 = 0, & 1 \text{ remainder} & d_2 = 1 \end{array}$$

Therefore, $487_{10} = 1E7_{16}$

Regroup bits to form an octal number

$$\begin{array}{ccccccc} & 1 & & E & & & 7 \\ & \underbrace{\hspace{1cm}} & \underbrace{\hspace{1cm}} & \underbrace{\hspace{1cm}} & & & \\ 0 & 0 & 0 & 1 & 1 & 1 & 0 & 0 & 1 & 1 & 1 \\ \hline & 0 & & 7 & & 4 & & 7 & & & \end{array}$$

start here

Therefore, $487_{10} = 747_8$

Unsigned arithmetic in the binary number system

Procedures we have long used for decimal arithmetic apply for any radix -

Adding decimal numbers: $5 + 3 + 6 = 14$
 carry digit \rightarrow sum digit

Adding bits: $1 + 1 + 0 = 2_{10} = 10_2$
 carry bit \rightarrow sum bit

Example: Add the 4-bit unsigned binary numbers $0111_2 + 0110_2$

Carry bits \rightarrow

$$\begin{array}{r} 110 \\ 0111 \\ + 0110 \\ \hline 1101 \end{array}$$

carry bit
sum bit

$(1+0 = 01)$
 $(0+1+1 = 10)$
 $(1+1+1 = 11)$
 $(1+0+0 = 01)$

An overflow condition occurs when not enough bits to represent the correct answer.

Example: Add 4-bit numbers 1011_2 and 0110_2 to obtain a 4-bit result.

$$\begin{array}{r} 111 \\ 1011 \\ + 0110 \\ \hline 10001 \end{array} = \begin{array}{r} 11_{10} \\ 6_{10} \\ \hline 17_{10} \end{array}$$

Here, the correct result needs 5 bits, but can only use 4 bits,
so the answer is 0001_2

Thus, $11_{10} + 6_{10} = 1_{10} ?!$

OVERFLOW
(largest 4-bit number $1111_2 = 15_{10}$)

Each column in the addition look like

$$\begin{array}{r} C_{in} \text{ (carry-in)} \\ + a \\ + b \\ \hline C_{out} \quad S \end{array}$$

Carry-out \rightarrow C_{out} S \leftarrow sum bit

This can be carried out with a 1-bit full adder circuit with the following truth table

a	b	C_{in}	C_{out}	S
0	0	0	0	0
0	0	1	0	1
0	1	0	0	1
0	1	1	1	0
1	0	0	0	1
1	0	1	1	0
1	1	0	1	0
1	1	1	1	1

all 8 possible combinations
