6 Signed binary numbers

Signed numbers include both negative and positive numbers. There three common signed number representations

1. Sign magnitude representation
2. One's complement
3. Two's complement

6.1 Sign-magnitude representation

The Most significant (left most) *bit* (binary digit) represents sign (0 = + and 1 = −), the rest represent the magnitude. Example, a 5-bit number $(11010)_2$ in signed magnitude representation has the value of $(-1010)_2 = -10$. Note that $+10$ has to be represented by a leading 0 at the most significant bit (MSB) $+10 = (01010)_2$. Hence, the number of bits have to be specified.

Problem 5 • *Write down all possible 4-digit binary numbers and corresponding decimal values if they are in signed magnitude format? What is the minimum and maximum value?*

- *What is the minimum and maximum value of n-digit signed binary number in sign-magnitude format?*

4-digit Binary		Decimal			n-digit
0000	=	+0		$(0000)_2 = (1000)_2$	
0001	=	+1			
0010	=	+2			
0011	=	+3			
0100	=	+4			
0101	=	+5			
0110	=	+6			
0111	=	+7	← Max	$2^3 - 1$	$2^{n-1} - 1$
1000	=	−0			
1001	=	−1			
1010	=	−2			
1011	=	−3			
1100	=	−4			
1101	=	−5			
1110	=	−6			
1111	=	−7	← Min	$-(2^3-1)$	$-(2^{n-1}-1)$

6.2 One's complement negation

Negate $13_{10} = 01101_2$ using 5-bit one's complement.

Negate -13_{10} using 5-bit one's complement.

6.3 One's complement binary numbers

Problem 6 *Determine the decimal values of the following 1's complement 6-digit binary numbers :*

1. *01101110*
2. *10101101*

Problem 7 *Convert the decimal numbers -17 and +23 into the 6-digit one's complement binary numbers and try adding them. What adjustments will you need to make to get the right result's (23-17=6) in binary representation.*

6.4 Two's complement negation

Negate $13_{10} = 01101$ using 5-bit two's complement.

Negate -13_{10} using 5-bit two's complement.

6.5 Two's complement representation

Problem 8 *Determine the decimal values of the following 2's complement 6-digit numbers :*

1. *01011110*
2. *10010111*

Problem 9 *Convert the decimal numbers -17 and +23 into the 6-digit two's complement binary numbers and try adding them. What adjustments will you need to make to get the right result's (23-17=6) in binary representation.*

Problem 10 *Convert the decimal numbers 73, 23, -17, and -163 into signed 8-bit numbers in the following representations:*

1. *Sign and magnitude*
2. *1's complement*
3. *2's complement*

6.6 Arithmetic overflow

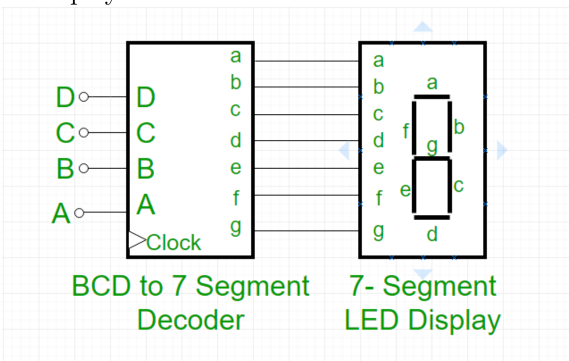
Problem 11 *Consider addition of 4-digit two's complement binary numbers*

1. $1010_2 + 1101_2$
2. $1011_2 + 1100_2$

In which case overflow happens? Can you come up with a rule to easily detect overflow?

7 Binary coded decimal

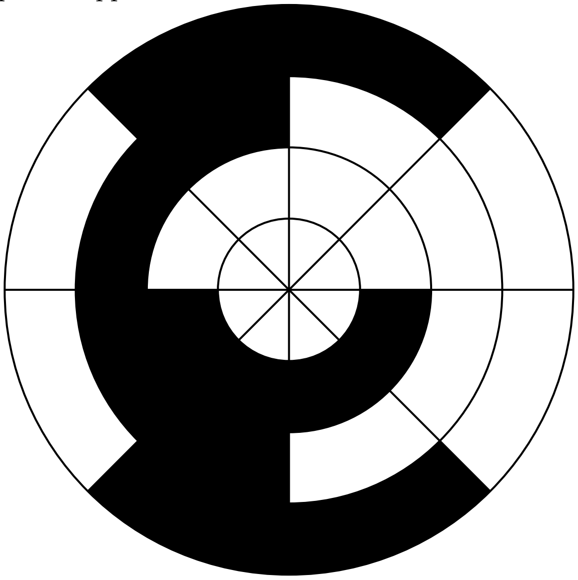
In Binary coded decimal (BCD), each decimal digit is represented by 4 bits. For example, $1047 = (0001\_0000\_0100\_0111)_{\mathrm{BCD}}$. It is useful in input-output applications where the number has to be either displayed as decimal or received as decimal.



Problem 12 *Convert 11, 23, 35, 57 and 103897 to BCD?*

8 Gray code

A sequence of binary numbers where only one bit changes when the number increases by 1. It is helpful in applications like wheel encoders



Problem 13 *Write all possible 3-bit binary numbers in gray-code*
